

Waste Minimisation

The Waste Minimisation Act

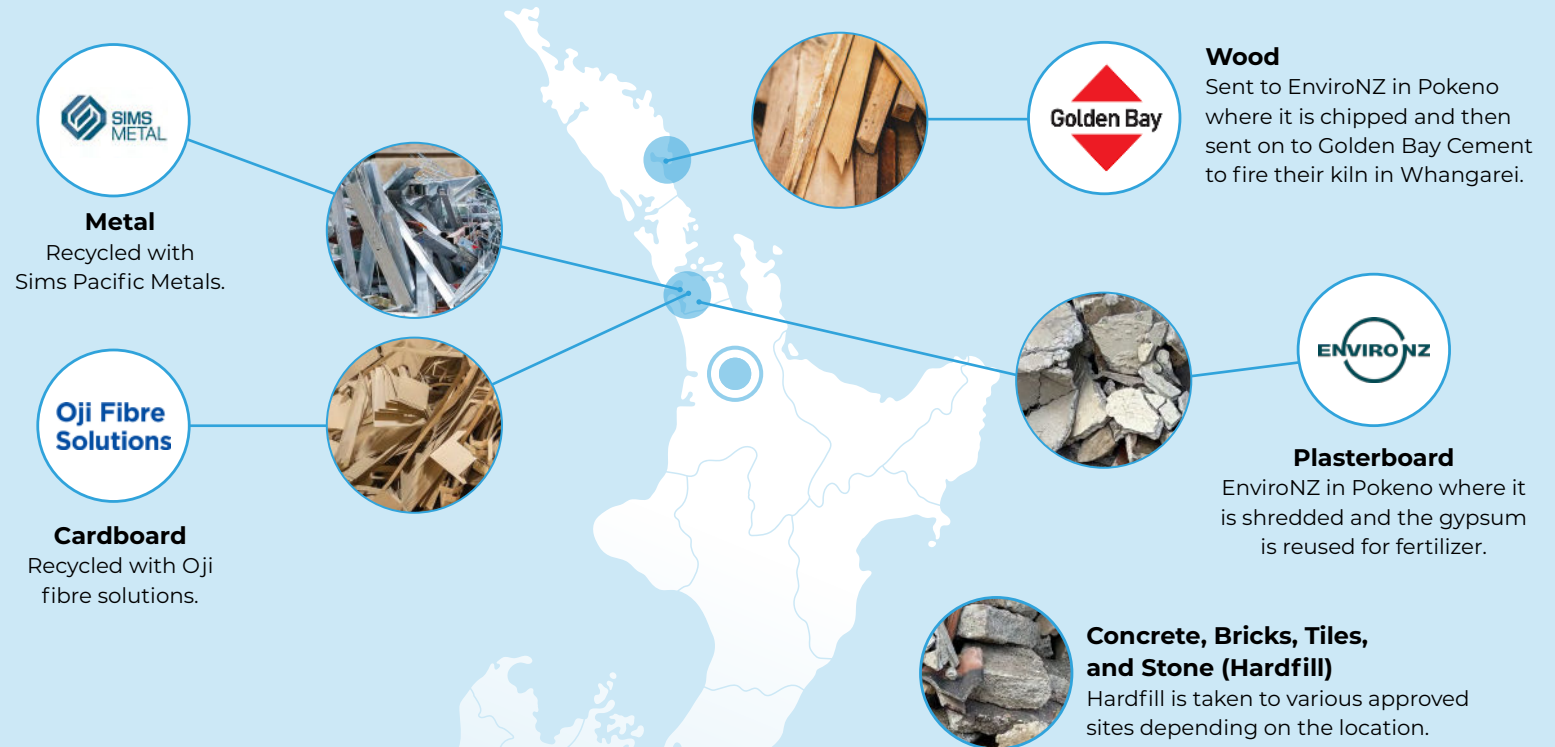

The government first introduced the act in 2008, it was recently updated in July 2024.

The purpose of this Act is to encourage waste minimisation and a decrease in waste disposal.

Practically that means the government wants us to reduce the amount of waste that we are sending to landfill. **Tirohia landfill is due to close in 2025 and Hampton Downs is expected to last until 2030.** These are the only landfills that are currently operating in the Waikato region. This makes it even more important to play our part to reduce what we are sending to landfill where we can.

At Wheelie Bin Services we have been playing our part for many years. We bring all skip bins back to our yard where they are tipped and sorted. We divert whatever materials we can from going to landfill.

The types of materials we routinely extract include:

Call us today to discuss how we can support with minimising waste.

Waste Minimisation

Meet your Waste Minimisation targets

We are uniquely placed to support the construction industry by helping to meet waste reduction targets. We can help with Waste Minimisation Plans that are now required with new building consent applications.

What We Can Do For You:

- Classify and weigh all materials from building sites
- Produce detailed reporting on volumes of diverted waste
- Simplify waste minimisation plans required for building consents

We are pulling out thousands of tonnes of materials each year and stopping these waste types from filling up the landfills.

We are really proud of the work that we are doing and the positive impact that work is having on the environment.

We are **one of the only waste collection companies** that takes a hands-on approach to waste minimization.

Using our services allows you to meet waste minimisation targets **without having to have multiple bins on site.** Something that is very impractical on a lot of build sites.

Call us today to discuss how we can support with minimising waste.
